

IT Asset Registers

An IT Asset Register is a comprehensive and centralized database of all the information technology assets that an organization possesses. It is used to keep track of all IT equipment, software licenses, and other IT-related assets, including hardware, software, and network components.

The IT Asset Register is a critical tool for IT managers as it provides them with valuable information on the current inventory of IT assets and their status, such as their location, configuration, and utilization. This information helps IT managers to make informed decisions about purchasing new assets, retiring old ones, and managing existing assets more efficiently.

The IT Asset Register is also used to track software licenses and ensure that the organization is in compliance with software license agreements. This is important as using software without a proper license can result in legal consequences and financial penalties.

Items to track include –

Hardware:

- Desktops
- Laptops
- Servers
- Network components (such as routers, switches, firewalls)
- Mobile devices (such as smartphones, tablets)
- Peripheral devices (such as printers, scanners, backup devices)

Software:

- Operating systems (such as Windows, Linux, MacOS)
- Application software (such as Microsoft Office, Adobe Creative Suite)
- Database management systems (such as Oracle, SQL Server)
- Collaboration tools (such as Microsoft Teams, Slack)
- Network security software (such as antivirus, anti-malware)
- Virtualization software (such as VMware, Hyper-V)
