

Switch

A network switch is a hardware device that connects multiple devices on a Local Area Network (LAN) and enables them to communicate with each other. It operates at the Data Link layer (Layer 2) of the OSI model and forwards data packets between devices based on their MAC addresses.

Router

A router is a networking device that connects multiple networks together and directs traffic between them. It operates at the Network layer (Layer 3) of the OSI model and uses IP addresses to route packets between different networks.

Gateway

A gateway is a networking device that connects different types of networks together, such as a LAN and a WAN, and enables communication between them. It can operate at various layers of the OSI model depending on the type of network being connected.

Firewall

A firewall is a network security device that monitors and controls incoming and outgoing network traffic based on a set of security rules. It can prevent unauthorized access to a network or system, protect against malware and other threats, and enforce network policies.

NTU

An NTU (Network Termination Unit) is a device used in telecommunications networks to terminate and convert optical signals into electrical signals for transmission over copper or wireless networks. It is commonly used to connect fiber optic lines to customer premises equipment, such as a router or switch, to enable high-speed internet access.
